**21** Adding the two equations and dividing by 10, we get :  $x+y = 10$  1/2  
 Subtracting the two equations and dividing by -2, we get :  $x-y = 1$  1/2  
 Solving these two new equations, we get,  $x = 11/2$  1/2  
 $y = 9/2$  1/2

**22** In  $\triangle ABC$ ,  
 $\angle 1 = \angle 2$   
 $\therefore AB = BD$  .....(i) 1/2  
 Given,  
 $AD/AE = AC/BD$   
 Using equation (i), we get 1/2  
 $AD/AE = AC/AB$  .....(ii)  
 In  $\triangle BAE$  and  $\triangle CAD$ , by equation (ii),  
 $AC/AB = AD/AE$  1/2  
 $\angle A = \angle A$  (common)  
 $\therefore \triangle BAE \sim \triangle CAD$  [By SAS similarity criterion] 1/2

**23**  $\angle PAO = \angle PBO = 90^\circ$  ( angle b/w radius and tangent) 1/2  
 $\angle AOB = 105^\circ$  (By angle sum property of a triangle) 1/2  
 $\angle AQB = \frac{1}{2} \times 105^\circ = 52.5^\circ$  (Angle at the remaining part of the circle is half the angle subtended by the arc at the centre) 1

**24** We know that, in 60 minutes, the tip of minute hand moves  $360^\circ$   
 In 1 minute, it will move  $= 360^\circ / 60 = 6^\circ$  1/2  
 $\therefore$  From 7 : 05 pm to 7: 40 pm i.e. 35 min, it will move through  $= 35 \times 6^\circ = 210^\circ$  1/2  
 $\therefore$  Area of swept by the minute hand in 35 min = Area of sector with sectorial angle  $\theta$   
 of  $210^\circ$  and radius of 6 cm  
 $= \frac{210}{360} \times \pi \times 6^2$  1/2  
 $= \frac{7}{12} \times \frac{22}{7} \times 6 \times 6$   
 $= 66\text{cm}^2$  1/2

**OR**

- 25  $\sin(A+B) = 1 = \sin 90$ , so  $A+B = 90$ .....(i) 1/2  
 $\cos(A-B) = \sqrt{3}/2 = \cos 30$ , so  $A-B = 30$ .....(ii) 1/2  
 From (i) & (ii)  $\angle A = 60^\circ$  1/2  
 And  $\angle B = 30^\circ$  1/2

**OR**

$$\frac{\cos\theta - \sin\theta}{\cos\theta + \sin\theta} = \frac{1-\sqrt{3}}{1+\sqrt{3}}$$

Dividing the numerator and denominator of LHS by  $\cos\theta$ , we get 1/2

$$\frac{1 - \tan\theta}{1 + \tan\theta} = \frac{1-\sqrt{3}}{1+\sqrt{3}}$$

Which on simplification (or comparison) gives  $\tan\theta = \sqrt{3}$  1/2  
 Or  $\theta = 60^\circ$  1/2

**SECTION - C**

- 26 Let us assume  $5 + 2\sqrt{3}$  is rational, then it must be in the form of  $p/q$  where  $p$  and  $q$  are co-prime integers and  $q \neq 0$  1
- i.e  $5 + 2\sqrt{3} = p/q$  1/2
- So  $\sqrt{3} = \frac{p-5q}{2q}$ .....(i) 1/2
- Since  $p, q, 5$  and  $2$  are integers and  $q \neq 0$ , HS of equation (i) is rational. But LHS of (i) is  $\sqrt{3}$  which is irrational. This is not possible. 1/2
- This contradiction has arisen due to our wrong assumption that  $5 + 2\sqrt{3}$  is rational. So,  $5 + 2\sqrt{3}$  is irrational. 1/2

- 27 Let  $\alpha$  and  $\beta$  be the zeros of the polynomial  $2x^2 - 5x - 3$   
 Then  $\alpha + \beta = 5/2$  1/2  
 And  $\alpha\beta = -3/2$ . 1/2  
 Let  $2\alpha$  and  $2\beta$  be the zeros  $x^2 + px + q$   
 Then  $2\alpha + 2\beta = -p$  1/2  
 $2(\alpha + \beta) = -p$   
 $2 \times 5/2 = -p$   
**So  $p = -5$**  1/2  
 And  $2\alpha \times 2\beta = q$  1/2  
 $4\alpha\beta = q$   
 So  $q = 4 \times -3/2$   
 $= -6$  1/2

28 Let the actual speed of the train be  $x$  km/hr and let the actual time taken be  $y$  hours. 1/2  
 Distance covered is  $xy$  km  
 If the speed is increased by 6 km/hr, then time of journey is reduced by 4 hours i.e.,  
 when speed is  $(x+6)$ km/hr, time of journey is  $(y-4)$  hours.  
 $\therefore$  Distance covered  $= (x+6)(y-4)$   
 $\Rightarrow xy = (x+6)(y-4)$   
 $\Rightarrow -4x + 6y - 24 = 0$  1/2  
 $\Rightarrow -2x + 3y - 12 = 0$  .....(i)  
 Similarly  $xy = (x-6)(y+6)$   
 $\Rightarrow 6x - 6y - 36 = 0$   
 $\Rightarrow x - y - 6 = 0$  .....(ii) 1/2  
 Solving (i) and (ii) we get  $x=30$  and  $y=24$  1  
 Putting the values of  $x$  and  $y$  in equation (i), we obtain  
 Distance  $= (30 \times 24)$ km  $= 720$ km. 1/2  
 Hence, the length of the journey is 720km.

**OR**

Let the number of chocolates in lot A be  $x$  1/2  
 And let the number of chocolates in lot B be  $y$   
 $\therefore$  total number of chocolates  $= x+y$   
 Price of 1 chocolate = ₹  $\frac{2}{3}$ , so for  $x$  chocolates  $= \frac{2}{3}x$   
 and price of  $y$  chocolates at the rate of ₹ 1 per chocolate  $= y$ .  
 $\therefore$  by the given condition  $\frac{2}{3}x + y = 400$  1/2  
 $\Rightarrow 2x + 3y = 1200$  .....(i)  
 Similarly  $x + \frac{4}{5}y = 460$  1/2  
 $\Rightarrow 5x + 4y = 2300$  ..... (ii)  
 Solving (i) and (ii) we get  
 $x=300$  and  $y=200$   
 $\therefore x+y=300+200=500$  1  
 So, Anuj had 500 chocolates. 1/2

29 LHS :  $\frac{\sin^3\theta / \cos^3\theta}{1 + \sin^2\theta / \cos^2\theta} + \frac{\cos^3\theta / \sin^3\theta}{1 + \cos^2\theta / \sin^2\theta}$  1/2

$$\begin{aligned}

 \text{Adding (1), (2), (3) and (4) we get} \\
 AP+BP+CR+DR &= AS+BQ+CQ+DS \\
 (AP+BP) + (CR+DR) &= (AS+DS) + (BQ+CQ) \\
 \therefore AB+CD &= AD+BC \text{-----}(5) && 1 \\
 \text{Since } AB=DC \text{ and } AD=BC \text{ (opposite sides of parallelogram ABCD)} && \frac{1}{2} \\
 \text{putting in (5) we get, } 2AB &= 2AD \\
 \text{or } AB &= AD. \\
 \therefore AB=BC=DC=AD \\

$AO = AO$  (Common)

Therefore,  $\triangle OPA \cong \triangle OCA$  (By SSS congruency criterion)

$\frac{1}{2}$

Hence,  $\angle 1 = \angle 2$  (CPCT)

$\frac{1}{2}$

Similarly  $\angle 3 = \angle 4$

$\angle PAB + \angle QBA = 180^\circ$  (co interior angles are supplementary as  $XY \parallel X'Y'$ )

$$2\angle 2 + 2\angle 4 = 180^\circ$$

$$\angle 2 + \angle 4 = 90^\circ \text{-----(1)}$$

$\frac{1}{2}$

$$\angle 2 + \angle 4 + \angle AOB = 180^\circ \text{ (Angle sum property)}$$

### SECTION D

- 32** Let the time taken by larger pipe alone to fill the tank =  $x$  hours  
Therefore, the time taken by the smaller pipe =  $x+10$  hours

$\frac{1}{2}$

Water filled by larger pipe running for 4 hours =  $\frac{4}{x}$  litres

Water filled by smaller pipe running for 9 hours =  $\frac{9}{x+10}$  litres

We know that

$$\frac{4}{x} + \frac{9}{x+10} = \frac{1}{2}$$

1

Which on simplification gives:

1

$$x^2 - 16x - 80 = 0$$

$$x^2 - 20x + 4x - 80 = 0$$

$$x(x-20) + 4(x-20) = 0$$

$$(x+4)(x-20) = 0$$

$$x = -4, 20$$

1

x cannot be negative.

1/2

Thus, x=20

1/2

$$x+10 = 30$$

Larger pipe would alone fill the tank in 20 hours and smaller pipe would fill the tank alone in 30 hours.

and the reduced speed of the plane be (x-200) km/hr

Distance = 600 km [Given]

According to the question,

(time taken at reduced speed) - (Schedule time) = 30 minutes = 0.5 hours.

1

$$\frac{600}{x-200} - \frac{600}{x} = \frac{1}{2}$$

Which on simplification gives:

1

$$x^2 - 200x - 240000 = 0$$

$$x^2 - 600x + 400x - 240000 = 0$$

$$x(x-600) + 400(x-600) = 0$$

$$(x-600)(x+400) = 0$$

$$x = 600 \text{ or } x = -400$$

1

But speed cannot be negative.

1/2

∴ The usual speed is 600 km/hr and

1/2

the scheduled duration of the flight is  $\frac{600}{600} = 1$  hour

Let ABCD be a trapezium  $DC \parallel AB$  and EF is a line parallel to AB and hence to DC.

To prove :  $\frac{DE}{EA} = \frac{CF}{FB}$

Construction : Join AC, meeting EF in G.

Proof :

In  $\triangle ABC$ , we have

$GF \parallel AB$

$$CG/GA = CF/FB \quad [\text{By BPT}] \quad \dots(1) \quad \frac{1}{2}$$

In  $\triangle ADC$ , we have

Slant height of conical part ( $l$ ) =  $\sqrt{r^2 + H^2}$

$$= \sqrt{(2.8)^2 + (2.1)^2} \quad 1$$

$$= \sqrt{7.84 + 4.41} \quad 1$$

$$= \sqrt{12.25} = 3.5 \text{ m} \quad 1$$

Area of canvas used to make tent = CSA of cylinder + CSA of cone 1

$$\text{Median} = l + \frac{\frac{n}{2} - cf}{f} \times h \quad \frac{1}{2}$$

Since,  $l=500$ ,  $h=100$ ,  $f=20$ ,  $cf=36+x$  and  $n=100$

Therefore, putting the value in the Median formula, we get;
