CHAPTER 6

LINES AND ANGLES

(A) Main Concepts and Results

Complementary angles, Supplementary angles, Adjacent angles, Linear pair, Vertically opposite angles.

- If a ray stands on a line, then the adjacent angles so formed are supplementary and its converse,
- If two lines intersect, then vertically opposite angles are equal,
- If a transversal intersects two parallel lines, then
 - (i) corresponding angles are equal and conversely,
 - (ii) alternate interior angles are equal and conversely,
 - (iii) interior angles on the same side of the transversal are supplementary and conversely,
- Lines parallel to the same line are parallel to each other,
- Sum of the angles of a triangle is 180°,
- An exterior angle of a triangle is equal to the sum of the corresponding two interior opposite angles.

(B) Multiple Choice Questions

Write the correct answer:

Sample Question 1 : If two interior angles on the same side of a transversal intersecting two parallel lines are in the ratio 2 : 3, then the greater of the two angles is

(A) 54° (B) 108° (C) 120° (D) 136°

Solution : Answer (B)

EXERCISE 6.1

Write the correct answer in each of the following:

- 1. In Fig. 6.1, if AB || CD || EF, PQ || RS, \angle RQD = 25° and \angle CQP = 60°, then \angle QRS is equal to
 - (A) 85° (B) 135° (C) 145° (D) 110°
- 2. If one angle of a triangle is equal to the sum of the other two angles, then the triangle is
 - (A) an isosceles triangle
 - (B) an obtuse triangle
 - (C) an equilateral triangle
 - (D) a right triangle
- **3.** An exterior angle of a triangle is 105° and its two interior opposite angles are equal. Each of these equal angles is

(A)
$$37\frac{1}{2}^{\circ}$$
 (B) $52\frac{1}{2}^{\circ}$ (C) $72\frac{1}{2}^{\circ}$ (D) 75°

- 4. The angles of a triangle are in the ratio 5 : 3 : 7. The triangle is
 - (A) an acute angled triangle (B) an obtuse angled triangle
 - (C) a right triangle (D) an isosceles triangle
- 5. If one of the angles of a triangle is 130°, then the angle between the bisectors of the other two angles can be

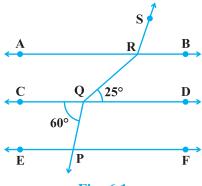

(A)
$$50^{\circ}$$
 (B) 65° (C) 145° (D) 155°

6. In Fig. 6.2, POQ is a line. The value of x is (A) 20° (B) 25° (C) 30°

 $\begin{array}{c} 4x \\ 40^{\circ} & 3x \\ P & O & Q \end{array}$

Fig. 6.2

(D)

35°

56

EXEMPLAR PROBLEMS

7. In Fig. 6.3, if OPIIRS, $\angle OPQ = 110^{\circ}$ and $\angle QRS = 130^{\circ}$, then $\angle PQR$ is equal to (A) 40° (B) 50° (C) 60° (D) 70°

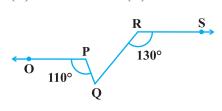

Fig. 6.3

8. Angles of a triangle are in the ratio 2:4:3. The smallest angle of the triangle is (A) 60° (B) 40° (C) 80° (D) 20°

(C) Short Answer Questions with Reasoning

Sample Question 1 :

Let OA, OB, OC and OD are rays in the anticlockwise direction such that $\angle AOB = \angle COD = 100^\circ$, $\angle BOC = 82^\circ$ and $\angle AOD = 78^\circ$. Is it true to say that AOC and BOD are lines?

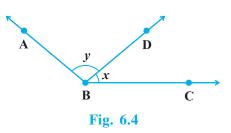

Solution : AOC is not a line, because $\angle AOB + \angle COB = 100^{\circ} + 82^{\circ} = 182^{\circ}$, which is not equal to 180°. Similarly, BOD is also not a line.

Sample Question 2 : A transversal intersects two lines in such a way that the two interior angles on the same side of the transversal are equal. Will the two lines always be parallel? Give reason for your answer.

Solution : In general, the two lines will not be parallel, because the sum of the two equal angles will not always be 180° . Lines will be parallel when each equal angle is equal to 90° .

EXERCISE 6.2

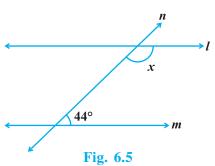

- 1. For what value of x + y in Fig. 6.4 will ABC be a line? Justify your answer.
- **2.** Can a triangle have all angles less than 60° ? Give reason for your answer.
- **3.** Can a triangle have two obtuse angles? Give reason for your answer.
- **4.** How many triangles can be drawn having its angles as 45°, 64° and 72°? Give reason for your answer.

Downloaded From :http://cbseportal.com/

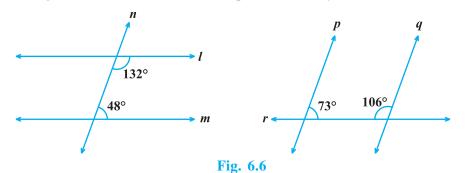

LINES AND ANGLES

- 5. How many triangles can be drawn having its angles as 53°, 64° and 63°? Give reason for your answer.
- 6. In Fig. 6.5, find the value of *x* for which the lines *l* and *m* are parallel.
- 7. Two adjacent angles are equal. Is it necessary that each of these angles will be a right angle? Justify your answer.

57

- 8. If one of the angles formed by two intersecting lines is a right angle, what can you say about the other three angles? Give reason for your answer.
- 9. In Fig.6.6, which of the two lines are parallel and why?

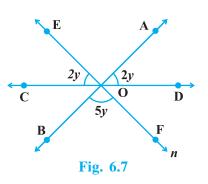

10. Two lines *l* and *m* are perpendicular to the same line *n*. Are *l* and *m* perpendicular to each other? Give reason for your answer.

(D) Short Answer Questions

Sample Question 1 : In Fig. 6.7, AB, CD and EF are three lines concurrent at O. Find the value of *y*.

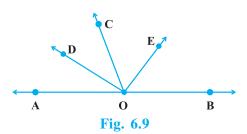

Solution : $\angle AOE = \angle BOF = 5y$ (Vertically opposite angles) Also, $\angle COE + \angle AOE + \angle AOD = 180^{\circ}$ So, $2y + 5y + 2y = 180^{\circ}$ or, $9y = 180^{\circ}$, which gives $y = 20^{\circ}$.

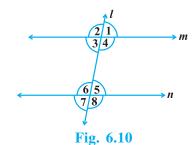

58 EXEMPLAR PROBLEMS **Sample Question 2 :** In Fig.6.8, x = y and a = b. m n Prove that $l \parallel n$. **Solution:** x = y (Given) Therefore, *l* || *m* (Corresponding angles) (1)v Also, a = b (Given) x Therefore, *n* || *m* (Corresponding angles) (2)a From (1) and (2), $l \parallel n$ (Lines parallel to the same line) Fig. 6.8

EXERCISE 6.3

1. In Fig. 6.9, OD is the bisector of $\angle AOC$, OE is the bisector of $\angle BOC$ and OD $\perp OE$. Show that the points A, O and B are collinear.

2. In Fig. 6.10, $\angle 1 = 60^\circ$ and $\angle 6 = 120^\circ$. Show that the lines *m* and *n* are parallel.

3. AP and BQ are the bisectors of the two alternate interior angles formed by the intersection of a transversal *t* with parallel lines *l* and *m* (Fig. 6.11). Show that AP \parallel BQ.

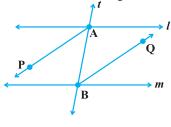

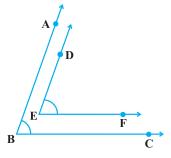

Fig. 6.11

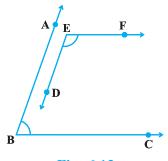

LINES AND ANGLES

- 4. If in Fig. 6.11, bisectors AP and BQ of the alternate interior angles are parallel, then show that $l \parallel m$.
- 5. In Fig. 6.12, BA || ED and BC || EF. Show that $\angle ABC = \angle DEF$ [Hint: Produce DE to intersect BC at P (say)].

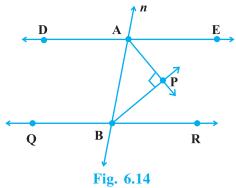

6. In Fig. 6.13, BA || ED and BC || EF. Show that \angle ABC + \angle DEF = 180°

7. In Fig. 6.14, DE || QR and AP and BP are bisectors of \angle EAB and \angle RBA, respectively. Find \angle APB.

59

EXEMPLAR PROBLEMS

- 8. The angles of a triangle are in the ratio 2 : 3 : 4. Find the angles of the triangle.
- **9.** A triangle ABC is right angled at A. L is a point on BC such that $AL \perp BC$. Prove that $\angle BAL = \angle ACB$.
- **10.** Two lines are respectively perpendicular to two parallel lines. Show that they are parallel to each other.

(E) Long Answer Questions

Sample Question 1: In Fig. 6.15, *m* and *n* are two plane mirrors perpendicular to each other. Show that incident ray CA is parallel to reflected ray BD.

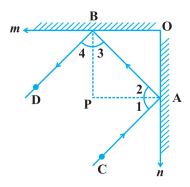

Fig. 6.15

Solution: Let normals at A and B meet at P.

As mirrors are perpendicular to each other, therefore, BP || OA and AP || OB.

So,
$$BP \perp PA$$
, i.e., $\angle BPA = 90^{\circ}$
Therefore, $\angle 3 + \angle 2 = 90^{\circ}$ (Angle sum property) (1)
Also, $\angle 1 = \angle 2$ and $\angle 4 = \angle 3$ (Angle of incidence
 $=$ Angle of reflection)
Therefore, $\angle 1 + \angle 4 = 90^{\circ}$ [From (1)] (2)

CA || BD

Adding (1) and (2), we have

i.e., $\angle 1 + \angle 2 + \angle 3 + \angle 4 = 180^{\circ}$ $\angle CAB + \angle DBA = 180^{\circ}$

Hence,

60

LINES AND ANGLES

Sample Question 2: Prove that the sum of the three angles of a triangle is 180°. **Solution:** See proof of Theorem 6.7 in Class IX Mathematics Textbook.

Sample Question 3: Bisectors of angles B and C of a triangle ABC intersect each other at the point O. Prove that $\angle BOC = 90^{\circ} +$

$$\frac{1}{2} \angle A$$
.

Solution: Let us draw the figure as shown in Fig. 6.16

 $\angle A + \angle ABC + \angle ACB = 180^{\circ}$ (Angle sum property of a triangle)

Therefore,
$$\frac{1}{2} \angle A + \frac{1}{2} \angle ABC + \frac{1}{2} \angle ACB = \frac{1}{2} \times 180^\circ = 90^\circ$$

i.e.,
$$\frac{1}{2} \angle A + \angle OBC + \angle OCB = 90^{\circ}$$
 (Since BO and CO are

bisectors of
$$\angle B$$
 and $\angle C$) (1)

But $\angle BOC + \angle OBC + \angle OCB = 180^{\circ}$ (Angle sum property) (2)

Subtracting (1) from (2), we have

$$\angle BOC + \angle OBC + \angle OCB - \frac{1}{2} \quad \angle A - \angle OBC - \angle OCB = 180^{\circ} - 90^{\circ}$$

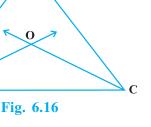

i.e., $\angle BOC = 90^{\circ} + \frac{1}{2} \quad \angle A$

EXERCISE 6.4

- 1. If two lines intersect, prove that the vertically opposite angles are equal.
- 2. Bisectors of interior $\angle B$ and exterior $\angle ACD$ of a $\triangle ABC$ intersect at the point T. Prove that

$$\angle$$
 BTC = $\frac{1}{2} \angle$ BAC.

3. A transversal intersects two parallel lines. Prove that the bisectors of any pair of corresponding angles so formed are parallel.

A

62

4. Prove that through a given point, we can draw only one perpendicular to a given line.

[Hint: Use proof by contradiction].

Prove that two lines that are respectively perpendicular to two intersecting lines intersect each other.
 [Hint: Use proof by contradiction]

[Hint: Use proof by contradiction].

- 6. Prove that a triangle must have atleast two acute angles.
- 7. In Fig. 6.17, $\angle Q > \angle R$, PA is the bisector of $\angle QPR$ and PM $\perp QR$. Prove that

$$\angle APM = \frac{1}{2} (\angle Q - \angle R).$$

Fig. 6.17
